Workflow Systems Audit

Inquiry intake and follow-up · Harbour Lane Dental (a fictional clinic) · prepared by DevLab Studios

1. The workflow, step by step

#	Step	Who	Tool	Finding
1	Inquiry arrives (web form, email, Messenger, phone)	Nobody named	Four inboxes	No single record; 3 of 4 channels have no owner
2	Front desk copies details into a spreadsheet	Front desk	Spreadsheet	Typed twice; done at end of day
3	Callback to book an appointment	Front desk	Phone	Works when the sheet is up to date
4	Booking entered in the clinic system	Front desk	Clinic system	Reliable once entered
5	Follow-up if no booking	Nobody named	None	Not done; inquiries go quiet

2. Where it stalls, and who owns each handoff

1. **Intake has no owner.** Messenger and email inquiries wait until someone happens to check.
2. **The spreadsheet is the record, but it is filled in late.** A callback depends on it.
3. **No follow-up step exists.** An inquiry without a booking is never revisited.

3. Data and integrations

Four inbound channels, one spreadsheet, one clinic system with a booking API. No integration today; every transfer is manual. Data shown in this sample is synthetic.

SAMPLE · fictional business · synthetic data

4. Recommended system, drawn

Every inquiry is saved once, gets a named owner and a due time, and stays visible until it is booked or closed with a reason. Bookings go to the clinic system through its API; a failed handoff is shown to a person, not dropped.

5. Roadmap, in priority order

1. **One intake record** for all four channels, with an owner. Phase 1
2. **A follow-up rule**: no booking after two working days goes back to the owner. Phase 1
3. **Booking handoff** to the clinic system, with failures visible. Phase 2
4. **Weekly report**: inquiries, bookings, and what is waiting. Phase 3

6. Decision point

Build it with DevLab Studios, with another team, or not at all. This recommendation is yours to use either way. Each phase is quoted separately, after this review.
